Introduction

Why am I standing here ?!

The Lab and it´s IPT / MAT – know-how

Over the years we used

- **Several liters of human fresh blood**
- **~ 40 different Lots of Human Cryoblood**
- **2004 – 2018: ~ 970 MAT – Kits**

Introduction

The test we use:

Monocyte Activation Test with **human whole blood (cryoblood)** –
Interleukin-1beta (**IL1- β**) as indicator

PyroDetect System – patented Procedure

IL-1 β Detection

We also tried

IL-6
TNF α

With corresponding results

Pyrogens

... any substance that causes fever

Pyrogens

Pyrogens can be divided into **two classes**:

- **exogenous** pyrogens, such as endotoxin from Gram-negative bacteria that induce fever when applied intravenously; But of course also Non-Endotoxin Pyrogens (NEP)

and

- **endogenous** pyrogens that are induced inside the body as a reaction to the contact with exogenous pyrogens and which cause an elevation in body temperature (endogenous pyrogens have potent pyrogenic and inflammatory activities and include interleukin 1-a (IL-1a), interleukin-1b (IL-1b), tumor necrosis factor a (TNF-a) and interleukin-6 (IL-6))

(Tim Sandle, 2015: Assessing Non-endotoxin Microbial Pyrogens in Relation in Pharmaceutical Processing)

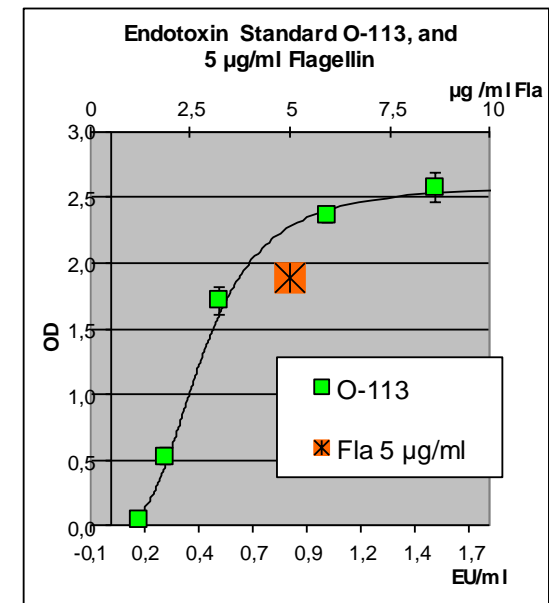

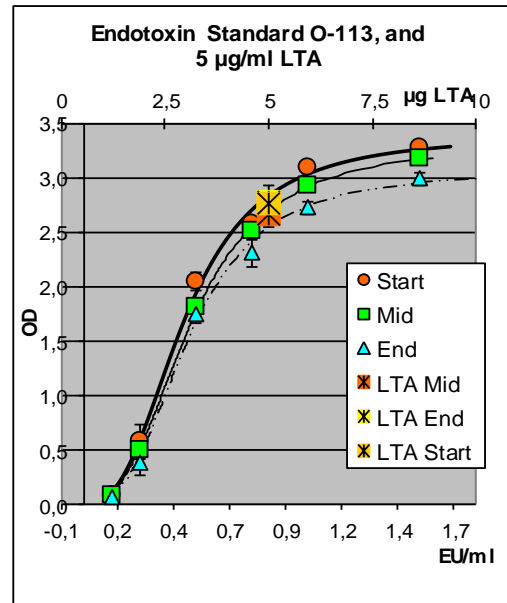

Pyrogens

Other Bacterial Pyrogens - Non-Endotoxin Pyrogens (NEP)

The actual EP 9.2, Chapter 2.6.30 wants to see Endotoxin and NEPs as pyrogenic substances, e.g. LTA and Flagellin to characterize the test system (e.g cryoblood)

Flagellin is the principal component of bacterial flagellum, and is present in large amounts on nearly all flagellated bacteria.

Pyrogens

Other Bacterial Pyrogens non-endotoxin pyrogens (NEP)

Bioburden and environmental monitoring assessments

can give information about the risk of significant levels of bacteria, fungi or other microbes, affecting products.

With focus on **Medical Device Productions**, the majority of detected microorganisms by an **microbiological monitoring** are **Gram Positive Bacteria** (Air, Surfaces, Humans/Skin),

... in contrast to **pharmaceutical** products, where **water** is a main source of pyrogens

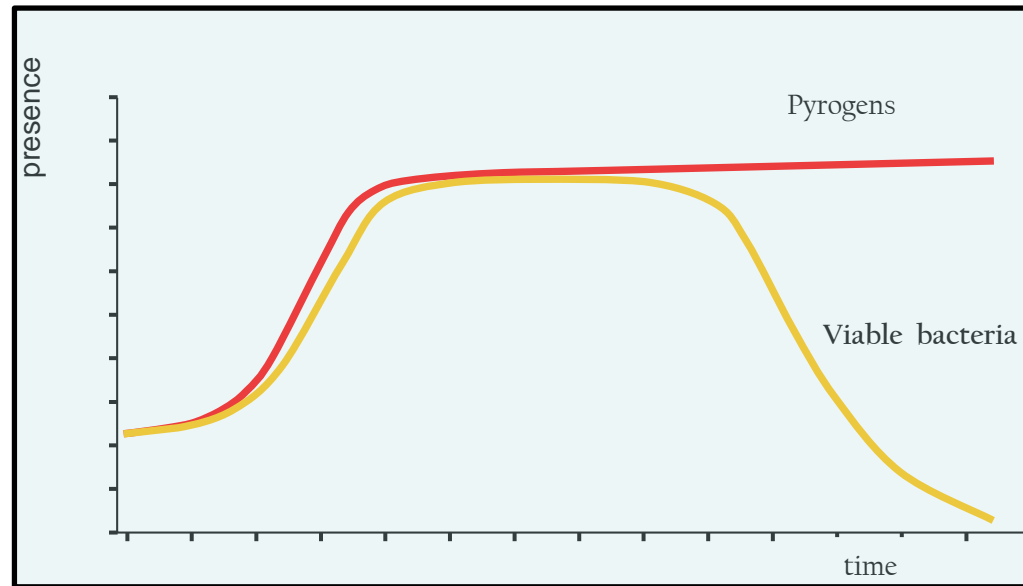

Pyrogens

Other Bacterial Pyrogens non-endotoxin pyrogens (NEP)

Bioburden and environmental monitoring assessments

can give information about the risk of significant levels of bacteria, fungi or other microbes, affecting products, but:

Pyrogens

Major Pyrogens, Source, Relevance

Pyrogenic Substance	Primary Source	Relevance
Endotoxin	Water	Washing / Rinsing / WFI
Lipoteichoic acids Peptidoglycans	Skin, Air bacteria, Raw material, water	Humans / Production conditions e.g. clean room
Fungal components	Air	Production conditions
Peptidoglycans	Raw material, Skin, Air	Production conditions
Viruses	Plasma	Blood products
Material mediated pyrogens	Raw material, e.g. plastics	Material tested as 'non-pyrogenic' with LAL

Pyrogens – Medical Devices

ENDOTOXIN LIMITS For Parenteral Drug Products

By Mick Dawson , April, 2017 BET White Paper vol.1 no.2 :

 **BET** White Paper
ASSOCIATES OF CAPE COD, INCORPORATED

ENDOTOXIN LIMITS
For Parenteral Drug Products
By Mick Dawson

April, 2017 BET White Paper vol.1 no.2

Medical Devices

USP chapter <161> set generic endotoxin limits of **20 EU/device** for most devices labeled as non-pyrogenic and **2.15 EU/device** for devices that contact the cerebrospinal fluid (CSF).

For anterior segment solid devices, an endotoxin limit of **≤ 0.2 EU/device** is given.

(...why not pyrogen limits ???)

Pyrogens – Medical Devices

Material mediated Pyrogens ...

exogenous pyrogens,

endogenous pyrogens

... two (– or three) classes:

Material mediated pyrogens – unknown origin, e.g particles or other molecules that can induce a fever reaction

Material mediated Pyrogens – so far tested with LAL (???) or rabbit test, but maybe not extractable ??!

Pyrogen Tests

The Test Method and it`s application(s)

Pyrogen-Tests

- Rabbit Test
- Limulus Amebocyte Lysate (LAL)
- Monocyte-Activation Test

Rabbit Test

- Each rabbit reacts individually
- Stress can influence the result
- No positive control
- For Med Dev: indirect Test (**Elution**)
- **Animal Test !**
- Some substances can not be tested

LAL

- Only **endotoxin** detection
- For Med Dev: indirect Test (**Elution**)
- Sensitive, easy and low price
- Somehow a kind of Animal Test
- Some substances can not be tested

Pyrogens – Medical Devices

A bit provoking thesis

- Current (LAL-) tests do not adequately control pyrogen contamination of medical devices
- Testing directly on surface is a paradigm shift (no extraction)
- Human relevant testing is possible (test system is at least closer)

Pyrogen Tests

The Test Method and it`s application(s)

Pyrogen-Tests

- Rabbit Test
- Limulus Amebocyte Lysate (LAL)
- **Monocyte-Activation Test (since 2017 compendial test for pyrogens, EP)**

MAT (whole blood, IL1b)

- Detects pyrogenic and pro-inflammatory contaminants (**endotoxins and non-endotoxins**)
- Test system: Fresh or cryo-preserved human blood
- **Human in-vitro** system
- For Med. Devices: **direct Test** (!!)

- Sensitivity (>0.125 EEU/ml)
- High price
- Some substances can not be tested (or only in high dilution)

MAT - IPT - Application for Medical Devices

IPT (InVitro PyrogenTest, for Medical Devices, internal Lab Wording)

The general principle (very shortly , Dinarello et al. 1981)

Sample,
Pyrogens
e.g.
LPS,
LTA

Cytokines, e.g.: IL-1 β

ELISA

OD

MAT - Application for Medical Devices vs. Pharma

IPT (InVitro PyrogenTest, for Medical Devices) MAT (for liquid, pharmaceutical Samples)

Main Differences – Regulatory Aspects:

<u>Medical Devices</u>	<u>Pharmaceuticals</u>
• ISO 10993-1/ -11 annex F (hint)	EP 2.6.30
• ISO/DTR 21582 (under develop. ?): Pyrogenicity ... testing of medical devices	
• General: Limit of 20 EEU/device 2.15 EU/device (cerebrospinal fluid) 0.2 EU/device (intraocular)	Specified limits

MAT - Application for Medical Devices vs. Pharma

IPT (InVitro PyrogenTest, for Medical Devices) MAT (for liquid, pharmaceutical Samples)

Main Differences – Nature of pyrogens:

- | | |
|-----------------------------|------------------------|
| ▪ <u>Medical Devices</u> | <u>Pharmaceuticals</u> |
| • Surface-attached pyrogens | Suspended pyrogens |

MAT - Application for Medical Devices vs. Pharma

IPT (InVitro PyrogenTest, for Medical Devices) MAT (for liquid, pharmaceutical Samples)

Main Differences – Nature of sample:

<u>Medical Devices</u>	<u>Pharmaceuticals</u>
<ul style="list-style-type: none">• Solid sample• No dilution possible• No homogeneous sample-batch• Spike on parallel sample	<p>Solution</p> <p>Dilutions</p> <p>Mainly homogeneous solutions</p> <p>Spike in +/- same sample</p>

MAT - Application for Medical Devices vs. Pharma

IPT (InVitro PyrogenTest, for Medical Devices) MAT (for liquid, pharmaceutical Samples)

Main Differences – Test setup:

▪ Medical Devices

Pharmaceuticals

- 1 blood-incubation – 3 (?)ELISA wells
- Semi-quantitative / quantitative

4 blood incubations – 4 ELISA wells
Quantitative Test (A); Limit Test (B) ,
Comparison Test (C)

At least two test items (NPC, PPC)

MAT - IPT - Application for Medical Devices

IPT (InVitro PyrogenTest, for Medical Devices)

1. Sample-Blood-Incubation in different Volumes / Containers

Fresh human blood or Cryoblood

MAT - IPT - Application for Medical Devices

IPT (InVitro PyrogenTest, for Medical Devices)

1. Sample-Blood-Incubation in different Volumes / Containers

Fresh human blood or Cryoblood

MAT - IPT - Application for Medical Devices

IPT (InVitro PyrogenTest, for Medical Devices)

Routine Analysis can consists of several NPC of a product and one spiked PPC (depending on batch size)

e.g. 3 + 1, 10 + 1

MAT - IPT - Application for Medical Devices

IPT (InVitro PyrogenTest, for Medical Devices)

2. Normal ELISA (Triplicates)

Standard, e.g.: Blank – 0.25 – 0.5 – 1.0 EU/ml

Approx. in the linear range of the sigmoid dose-response-curve

Samples: at least 2 Samples (NPC, PPC),

= test for interfering factors (50-200%)

MAT - IPT - Application for Medical Devices

IPT (InVitro PyrogenTest, for Medical Devices)

3. Results:

optical densities from
standard , NPC and PPC

High Accuracy
Low Precision

Low Accuracy
High Precision
Wikipedia

ICH Q2 (R1) Validation of an Analytical Procedure

Testing for Impurities (quantitative)

- Accuracy Spike-Recovery within **50-200%**
- Precision Repeatability (same sample, same conditions)
Intermediate Precision (same sample, different day, different conditions) ; **CV<20%**, but single events >40% (small values)
- Specificity Detection of different Impurities: LPS, **LTA**, **Flagellin**, Bacteria, **Yeast** (Zymosan)
- Cut-off, IPT Standard-curve (internal Lab Definition Limit Test: 3 * Blank)
- Cut-off, MAT Standard-curve (Blank+ 3*sdv)
- LOD, MAT First value above cut-off (Blank+ 3*sdv = ~ **0,1 EEU/ml**)
- LOD, IPT First value above cut-off (= **Limit Test: 0.25 EEU/ml**)
- Linearity Standard-curve (~ 0.5 EU/ml, p<0.01)
- Range **Standard-curve (0,125 – 1.5 EU/ml)**

MAT - IPT - Application for Medical Devices

IPT (InVitro PyrogenTest, for Medical Devices)

Why the IPT:

- Direct Test – no Elution (Big Point!)
- Surface-attached Pyrogens detected
= material-mediated Pyrogens?
- Detection of PYROGENS (Big Point!)
- Production-Monitoring: gram+ (Big Point!)
- Sensitivity is fine for Medical Devices
- Human Blood – close to reality (Big Point!)
- No Animal Test (Big Point!)

MAT - IPT - Application for Medical Devices - Problems

IPT (InVitro PyrogenTest, for Medical Devices)

**In general the MAT is a
straightforward method for Medical Devices,
with a (lower) detection limit of about 0.025 EEU / device
up to 0.2 EEU/device (setups we use routinely)**

**depending of the blood/buffer volume of the assay
– and this depends of the size of the Medical Device**

MAT - IPT - Application for Medical Devices - Problems

IPT (InVitro PyrogenTest, for Medical Devices)

**In general the MAT is a
straightforward method for Medical Devices,**

... but

MAT - IPT - Application for Medical Devices - Problems

IPT (InVitro PyrogenTest, for Medical Devices)

In general the MAT is a straightforward method for Medical Devices,

... but

The size of a Med Dev. is critical

angled sample in a round hole

MAT - IPT - Application for Medical Devices - Problems

IPT (InVitro PyrogenTest, for Medical Devices)

The size of a Med Dev. is critical

Sometimes a dummy which went through the production process in parallel can be used to control the process

MAT - IPT - Application for Medical Devices - Problems

IPT (InVitro PyrogenTest, for Medical Devices)

Endotoxin Limits for Medical Devices

20 EU/device

2.15 EU/device

0.2 EU/device
